BRIEF HISTORY OF FEM

- Has been used since 1950's in solid mechanics
- in the 1970's FEM began to be used in CFD
- nowadays FEM is applicably to many engineering problems

Heat transfer, fluid flow, electromagnetic fields, solid mechanics, acoustics, biomechanics etc.

Finite Element Method - FEM	Finite Volume Method - FVM	Finite Difference Method - FDM
strong math complex geometry element geometry master element high memory flexible	flux formulation complex geometry conservative low memory	easy math simple geometries grid systems low memory not flexible

FINITE ELEMENT METHOD

PDE — Governing equations (heat equation, Maxwell equation, Navier-Stokes equation)

weak form — Variational form

ODE — Set of Ordinary Differential Equations

Approximation functions: The Galerkin Method

linear system — Ax=b

approximated solution — solution for x
$x=A^{-1}b$
$x=[u,v,w,p,T,c]$

The approximation functions are combined with the weak form to obtain the discrete finite element equations.

CHOICE OF FUNCTIONS

Finite element function properties:

- the shape functions are 1 at the node and zero elsewhere;
- the sum of all shape function at the element is 1 everywhere, including boundary;
- the weight function is zero at boundary for Dirichlet b.c.

Chart:

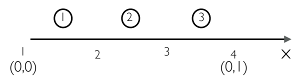
function	node, i	node, j	x
Ni	1	0	between 0 e 1
Nj	0	1	between 0 e 1
Ni+Nj	1	1	1

1D PROBLEM - STRONG FORM

Find u in $\Omega = [0,1]$ such that:

$$\frac{d^2u}{dx^2} + u + 1 = 0 \qquad \left| \begin{array}{l} u(0) = 0 \\ \frac{du}{dx}(1) = 1 \end{array} \right. \leftarrow \text{boundary condition}$$

domain: $h_1 = h_2 = h_3 = 1/3$



MESH GENERATION

1D PROBLEM - WEAK FORM

Find u in H^1 with b.c. such that:

$$\int_\Omega w\left(\frac{d^2u}{dx^2}+u+1\right)d\Omega = 0$$

weight function

mathematical procedure (integration by parts)

$$\int_0^1 w\frac{d^2u}{dx^2}dx + \int_0^1 wudx + \int_0^1 dx = 0$$

$$w\frac{du}{dx}\bigg|_0^1 - \int_0^1 \frac{du}{dx}\frac{dw}{dx}dx + \int_0^1 wudx + \int_0^1 wdx = 0$$

$$w\frac{du}{dx}\bigg|_1 - w\frac{du}{dx}\bigg|_0 - \int_0^1 \frac{du}{dx}\frac{dw}{dx}dx + \int_0^1 wudx + \int_0^1 wdx = 0$$

1D PROBLEM - WEAK FORM

$$w\frac{du}{dx}\bigg|_1 - w\frac{du}{dx}\bigg|_0 - \int_0^1 \frac{du}{dx}\frac{dw}{dx}dx + \int_0^1 wudx + \int_0^1 wdx = 0$$

apply boundary conditions to the equation in the continuous form:

$$w(1)\cancelto{1}{\frac{du}{dx}(1)} - \cancelto{0}{w(0)}\frac{du}{dx}(0) - \int_0^1 \frac{du}{dx}\frac{dw}{dx}dx + \int_0^1 wudx + \int_0^1 wdx = 0$$

$$w(1) - \int_0^1 \frac{du}{dx}\frac{dw}{dx}dx + \int_0^1 wudx + \int_0^1 wdx = 0$$

GALERKIN METHOD

Approximate functions: $\hat{u} = \sum_{i=1}^{4} N_i(x)u_i \quad \hat{w} = \sum_{j=1}^{4} N_j(x)w_j$

$$w(1)\frac{du}{dx}(1) - w(0)\frac{du}{dx}(0) - \sum_{i=j=1}^{4}\int_0^1 \frac{dN_i}{dx}u_i\frac{dN_j}{dx}w_jdx +$$

$$+\sum_{i=j=1}^{4}\int_0^1 N_iu_iN_jw_jdx + \sum_{j=1}^{4}\int_0^1 N_jw_jdx = 0$$

$$\sum_{i=1}^{4}\sum_{j=1}^{4}\left(\int_0^1 \underbrace{\boxed{\frac{dN_i}{dx}\frac{dN_j}{dx}}}_{\text{stiffness matrix } K_{ij}}dx - \int_0^1 \underbrace{\boxed{N_iN_j}}_{\text{mass matrix } M_{ij}}dx\right)u_i = \sum_{j=1}^{4}\int_0^1 \underbrace{\boxed{N_j}}_{\text{right hand side. } b_i}dx + \underbrace{\boxed{w(1)\frac{du}{dx}(1) - w(0)\frac{du}{dx}(0)}}_{\text{boundary condition}}$$

GALERKIN METHOD

$$\sum_{i=1}^{4}\sum_{j=1}^{4}\left(\int_0^1 \boxed{\frac{dN_i}{dx}\frac{dN_j}{dx}}dx - \int_0^1 \boxed{N_iN_j}dx\right)u_i = \sum_{j=1}^{4}\int_0^1 \boxed{N_j}dx + \boxed{w(1)\cancelto{1}{\frac{du}{dx}}(1) - \cancelto{0}{w}(0)\frac{du}{dx}(0)}$$

Replacing the shape function to the B.C.
Note that w_j is present at all members and can be removed!

$$\sum_{i=1}^{4}\sum_{j=1}^{4}\left(\int_0^1 \boxed{\frac{dN_i}{dx}\frac{dN_j}{dx}}dx - \int_0^1 \boxed{N_iN_j}dx\right)u_i = \sum_{j=1}^{4}\int_0^1 \boxed{N_j}dx + \boxed{N_j(1)}$$

apply boundary conditions to the equation
in the continuous form:

$$w(1)\cancelto{-u}{\frac{du}{dx}}(1) - \cancelto{0}{w(0)}\frac{du}{dx}(0) - \int_0^1 \frac{du}{dx}\frac{dw}{dx}dx + \int_0^1 wu\,dx + \int_0^1 w\,dx = 0$$

$$(K_{ij} - M_{ij})u_i = b_i + b.c.$$

$$\sum_{i=1}^{4}\sum_{j=1}^{4}\Bigg(\int_0^1 \frac{dN_i}{dx}\frac{dN_j}{dx}dx - \int_0^1 N_i N_j dx\Bigg)u_i + w(1)u(1) = \sum_{j=1}^{4}\int_0^1 N_j dx - \cancelto{0}{w(0)}\frac{du}{dx}(0)$$

Replacing the shape function to the B.C.
Note that w_j is present at all members and can be removed!

$$\sum_{i=1}^{4}\sum_{j=1}^{4}\left[\int_0^1 \frac{dN_i}{dx}\frac{dN_j}{dx}dx - \int_0^1 N_i N_j dx + N_i(1)N_j(1)\right]u_i = \sum_{j=1}^{4}\int_0^1 N_j dx$$

2D PROBLEM - WEAK FORM

Find u in H^1 such that:

$$\int_\Omega w\left(\nabla^2 u\right) d\Omega = 0$$

weight function

$$\int_\Omega w\nabla^2 u d\Omega = \int_\Omega w\left(\frac{\partial^2 u}{\partial x^2} + \frac{\partial^2 u}{\partial y^2}\right) d\Omega = 0$$

$$\oint_\Gamma w\,\nabla u\, d\Gamma - \int_\Omega \nabla w \cdot \nabla u\, d\Omega = 0$$
